

# CalPal Requirements

CJ Guttormsson, Ben Romano, and Bryan Anderson

# What Our Product Is

- Problem:
  - Other calendar apps exist, but are limited
  - Coordinating with others can be difficult
  - No way to find new events easily
- Focuses of our calendar
  - Let users share their events with others easily, and with granular control
  - Allow friends or colleagues to find common time easily
  - Make discovery of nearby events seamless

# Glossary

**Friend:** Someone with whom you share calendar access

**Event Visibility:**

Hidden: Not shown to anyone

Friends: Only shown to friends

Partial: Show to friends, but hide details

Locations: Anyone within a radius can see

**OAuthToken:** Token generated by Google to allow logins

**Event info:** Attributes of an event, including start and stop time, location, description, and Friends who are invited

**Database:** the remote backend that stores user's events, friends, etc.

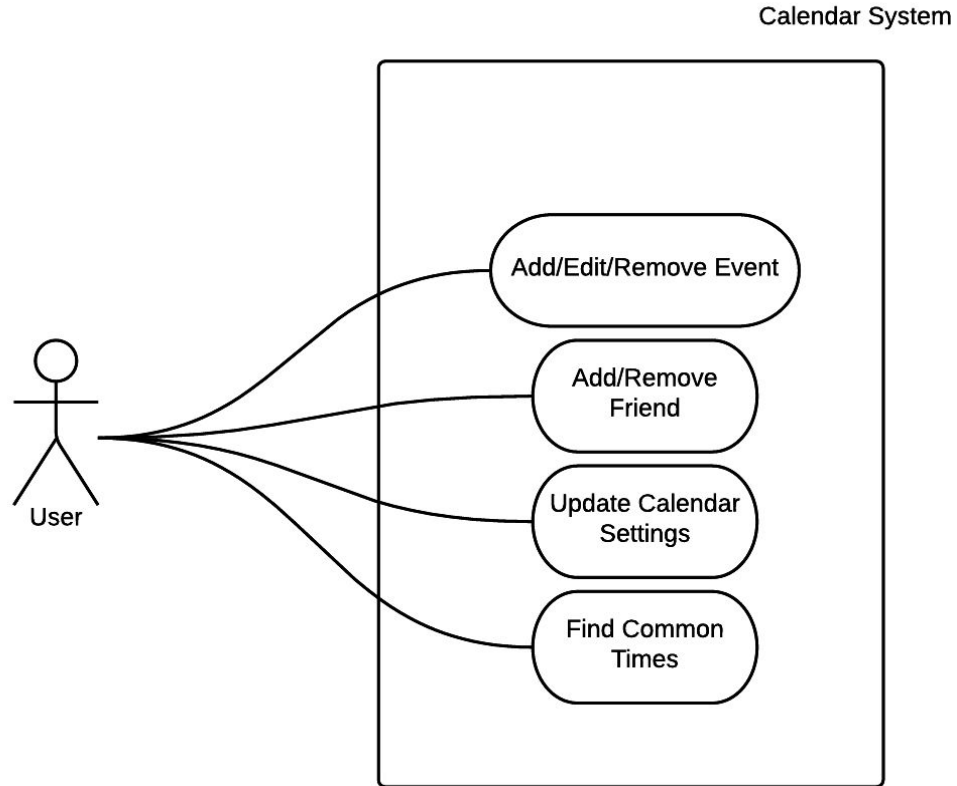

# Functional Requirements

- User must have a Google+ account
- User able to login using Google+ and give our app permission to all their calendars; although, only one will be used
- User is able to find friends by email address
- User needs GPS enabled to use location-based features
- User is able to find upcoming events
- User is able to find common times with other users
- User is able to create events

# Non-Functional/Performance Requirements

- Calendars must sync within 10 minutes of making a change
  - Includes visibility to those it's shared with
- The app must run without crashing on device with Lollipop or greater
- The app must not drain more battery life than necessary
  - Syncing should be kept to minimum
  - Not use location services too much
- Startup should take no longer than three seconds
- The user should be able to view the calendar by day, week, or month

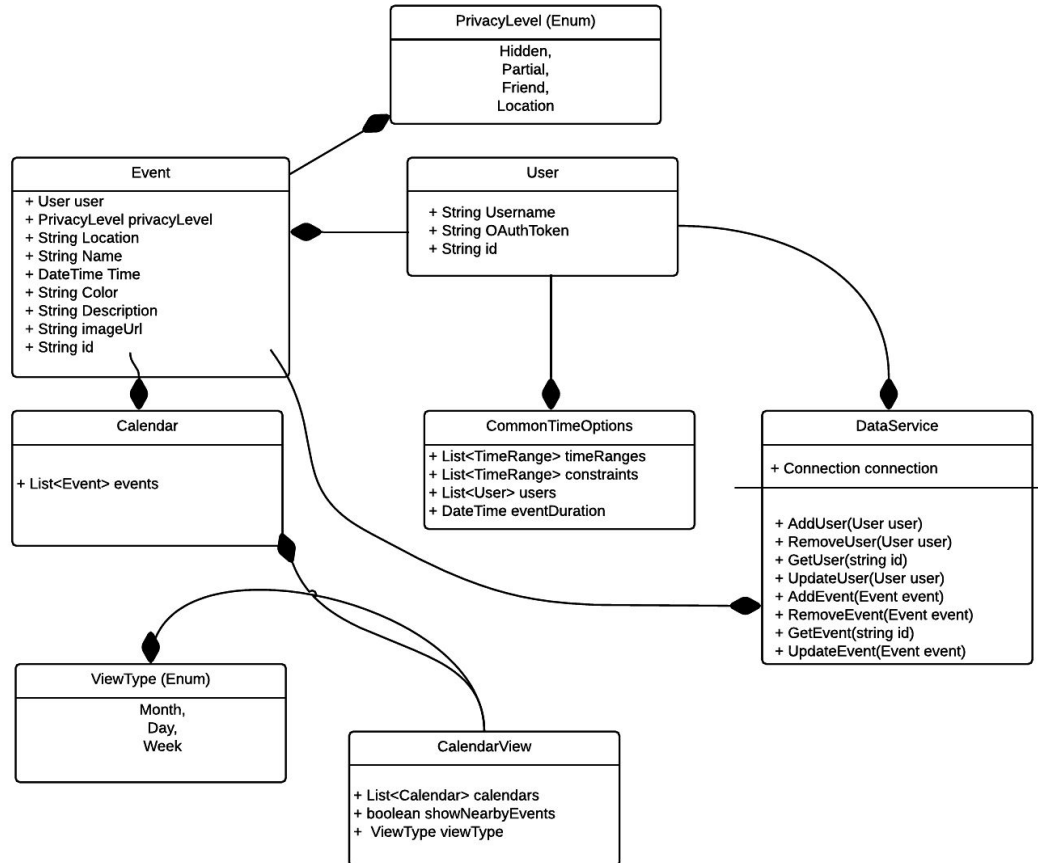

# Use Case Diagram

# Classes

- Calendar
  - Contains event and user who the calendar belongs to if associated with a user
- CalendarView
  - Stores calendars to display
  - Has display settings (month, day, view)
  - Stores which one is the main calendar
- Event
  - Contains event info (description, times, etc.)
- CommonTimeOptions
  - Used to find common time between friends
- DataService
  - Interacts with database

# Future Features

- Syncing from other services
  - Facebook, school account
- Allow an user to maintain multiple calendars
  - Work, personal, etc.
- Notifications for upcoming events
- Adding pictures to events

# Risks

- Difficulties in development
  - Unable to learn Android APIs, Android Studio
  - Unable to create a backend that can
- Difficulties from outside sources
  - Problems with Google OAuth and Calendar APIs
  - Unable to find way to host backend
- Difficulty syncing calendar with our custom events

# Summary and Conclusion
